GENERAL PATTERN OF VITAL REGISTRATION AND STATISTICS IN THE UNITED STATES

RESPONSIBLE PERSON OR AGENCY	BIRTH CERTIFICATE	DEATH CERTIFICATE	FETAL DEATH CERTIFICATE (Stillbirth)	REPORTING OFFICIALS	MARRIAGE RECORD	DIVORCE OR ANNULMENT RECORD
Physician, Other Professional Attendant, or Hospital Authority	<ol style="list-style-type: none"> 1. Completes entire certificate in consultation with parent(s). Physician's signature required. 2. Files certificate with local office of district in which birth occurred. 	<ol style="list-style-type: none"> 1. Completes medical certificate and signs certificate. 2. Returns certificate to funeral director. 	<ol style="list-style-type: none"> 1. Completes or reviews medical items on certificate. 2. Certifies to the cause of fetal death and signs certificate. 3. Returns certificate to funeral director. 4. In absence of funeral director, files certificate. 	Clerk of Local Government	<ol style="list-style-type: none"> 1. Receives application for marriage license, and reviews application for completeness, accuracy, and compliance with law. 2. Issues marriage license, and records date. 3. Checks completeness of entries about the marriage ceremony. 4. Sends specified information regarding marriage to State Registrar. 	
Funeral Director		<ol style="list-style-type: none"> 1. Obtains personal facts about deceased. 2. Takes certificate to physician for medical certification. 3. Delivers completed certificate to local office of district where death occurred and obtains burial permit. 	<ol style="list-style-type: none"> 1. Obtains the facts about fetal death. 2. Takes certificate to physician for entry of causes of fetal death. 3. Delivers completed certificate to local office of district where delivery occurred and obtains burial permit. 	Marriage Officiant	<ol style="list-style-type: none"> 1. Checks the validity of the marriage license. 2. Performs the marriage ceremony. 3. Certifies to the facts of the marriage ceremony. 4. Returns the record to the license clerk within the legally prescribed time. 	
Local Office (may be Local Registrar or City or County Health Department)	<ol style="list-style-type: none"> 1. Verifies completeness and accuracy of certificate. 2. Makes copy, ledger entry, or index for local use. 3. Sends certificates to State Registrar. 	<ol style="list-style-type: none"> 1. Verifies completeness and accuracy of certificate. 2. Makes copy, ledger entry, or index for local use. 3. Issues burial permit to funeral director and verifies return of permit from cemetery attendant. 4. Sends certificates to State Registrar. 		Clerk of Court		<ol style="list-style-type: none"> 1. Provides form for report to plaintiff or attorney, or makes entries on such form from petition for decree. 2. Verifies entries on return form. 3. Enters information on final decree. 4. Sends completed report to State Registrar.
City and county health departments use certificates in allocating medical and nursing services, followups on infectious diseases, planning programs, measuring effectiveness of services, and conducting research studies.				Attorney for Plaintiff		<ol style="list-style-type: none"> 1. Enters personal characteristics of spouses. 2. Returns form to Clerk of Court.
State Registrar, Bureau of Vital Statistics	<ol style="list-style-type: none"> 1. Queries incomplete or inconsistent information. 2. Maintains files for permanent reference and as the source of certified copies. 3. Develops vital statistics for use in planning, evaluating, and administering State and local health activities and for research studies. 4. Compiles health related statistics for State and civil divisions of State for use of the health department and other agencies and groups interested in the fields of medical science, public health, demography, and social welfare. 5. Prepares copies of birth, death, fetal death, marriage, and divorce certificates or records for transmission to the National Center for Health Statistics. 					
Public Health Service National Center for Health Statistics	<ol style="list-style-type: none"> 1. Prepares and publishes national statistics of births, deaths, fetal deaths, marriages, and divorces; and constructs the official U.S. life tables and related actuarial tables. 2. Conducts health and social-research studies based on vital records and on sampling surveys linked to records. 3. Conducts research and methodological studies in vital statistics methods including the technical, administrative, and legal aspects of vital records registration and administration. 4. Maintains a continuing technical assistance program to improve the quality and usefulness of vital statistics. 					

NOTE.—In some States there is no central file for marriage and divorce records at the State level.

VITAL STATISTICS OF THE UNITED STATES, 1979

VOLUME I — NATALITY

A brief summary of the contents for each section is listed below for the convenience of the reader. A complete table of contents is shown at the beginning of each section and is identified by a narrow black edge, which can be located easily by fanning the pages. Each section is paged independently, using the section number as the identifying prefix.

Section 1. Natality—Rates and Characteristics

Summary tables showing trends in period and cohort fertility measures and characteristics of live births including race, age of mother, age of father, live-birth order, sex, month, attendant and place of delivery, interval since last live birth and last pregnancy, educational attainment of mother and father, marital status of mother, and month of pregnancy prenatal care began.

Detailed frequency tabulations for each State, each metropolitan area, and other geographic areas of the United States. Data are shown by race, sex, place of birth of mother, month, age of mother, age of father, live-birth order, interval since last live birth and last pregnancy, educational attainment of mother and father, attendant and place of delivery, birth weight, period of gestation, plurality, marital status of mother, month of pregnancy prenatal care began, number of prenatal visits, and Apgar score.

Section 2. Natality—Local Area Statistics

Frequency tabulations by place of residence and occurrence for each State, county, and city with a population of 10,000 or more by race and place of delivery and by place of residence for population-size groups in metropolitan and nonmetropolitan counties within each State by race, attendant and place of delivery, and birth weight.

Section 3. Natality—Puerto Rico, the Virgin Islands (U.S.), and Guam

Trends in the crude birth rate. Frequency tabulations by race, sex, month, age of mother, age of father, live-birth order, place of delivery, birth weight, marital status of mother, educational attainment of mother, month of pregnancy prenatal care began, Apgar score, and place of residence and occurrence.

Section 4. Technical Appendix

Text discussion of the source, classification, and quality of the natality statistics published in this volume. Includes population tables for computing vital rates.

Section 1. Natality

Table	Page
1-1. Live births, birth rates, and fertility rates, by race: United States, 1909-79-----	1-7
1-2. Registered live births and birth rates, by race: Birth-registration States, 1915-32, and United States, 1933-59 ---	1-8
1-3. Age-sex-adjusted birth rates by race: United States, 1940-79 -----	1-9
1-4. Gross and net reproduction rates by color: United States, 1940-79 -----	1-9
1-5. Intrinsic rates of birth, death, and natural increase, by color: United States, 1940, 1950, and 1960-79 -----	1-10
1-6. Total fertility rates and birth rates by age of mother and race: United States, specified years 1940-55 and each year 1960-79-----	1-11
1-7. Birth rates by age of father and race: United States, 1940, 1950, and 1960-79 -----	1-13
1-8. Birth rates by live-birth order and race: United States, specified years 1940-55 and each year 1960-79 -----	1-15
1-9. Birth rates by age of mother, live-birth order, and race: United States, 1979-----	1-17
1-10. Percent distribution of live births by live-birth order, by age of mother and race: United States, 1979-----	1-18
1-11. Median age of mother by live-birth order and race: United States, specified years 1940-60 and each year 1965-79-----	1-19
1-12. Birth probabilities by parity, exact age, and color: United States, specified years 1940-65 and each year 1970-79-----	1-20
1-13. Percent distribution of women by parity, by exact age and color, in selected groups of cohorts from 1896-1900 to 1961-65: United States, 1940-80 -----	1-24
1-14. Central birth rates by live-birth order, current age of mother, and color, for women in selected groups of cohorts from 1896-1900 to 1960-64: United States, 1940-79 -----	1-28
1-15. Cumulative birth rates by live-birth order, exact age of mother, and color, for women in selected groups of cohorts from 1886-90 to 1961-65: United States, 1940-80-----	1-32
1-16. Birth probabilities by parity, exact age, and color, for women in each cohort from 1930 to 1964: United States, 1979 -----	1-37
1-17. Percent distribution of women by parity, by exact age, and color, for women in each cohort from 1930 to 1965: United States, 1980 -----	1-39
1-18. Central birth rates by live-birth order, current age of mother, and color, for women in each cohort from 1930 to 1965: United States, 1979 -----	1-41
1-19. Cumulative birth rates by live-birth order, exact age of mother, and color, for women in each cohort from 1930 to 1965: United States, 1980-----	1-43
1-20. Live births by sex and sex ratio, by race: United States, specified years 1940-65 and each year 1970-79-----	1-44
1-21. Percent completeness of birth registration by color: United States, 1933-79 -----	1-45
1-22. Live births, birth rates, and fertility rates, by month: United States, 1970-79 -----	1-45
	1-1

Table	Page
1-23. Birth rates and fertility rates by month, adjusted for seasonal variation: United States, 1970-79 -----	1-46
1-24. Percent distribution of live births by interval since last live birth, by age of mother and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-46
1-25. Percent distribution of live births by interval since last live birth, by live-birth order and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-47
1-26. Mean interval since last live birth by age of mother, live-birth order, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-48
1-27. Mean interval since last live birth by educational attainment of mother, live-birth order, age of mother, and race: Total of 45 reporting States and the District of Columbia, 1979-----	1-49
1-28. Mean interval since termination of last pregnancy by outcome of last pregnancy, live-birth order, age of mother, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-51
1-29. Percent distribution of live births by educational attainment of mother and father, by race of child: Total of 46 reporting States and the District of Columbia, 1979-----	1-52
1-30. Percent distribution of live births by educational attainment of mother, by age of mother and race: Total of 46 reporting States and the District of Columbia, 1979-----	1-53
1-31. Estimated number and ratio of births to unmarried women, by race: United States, 1940-79 -----	1-54
1-32. Estimated birth rates for unmarried women by age of mother and race: United States, specified years, 1940-55 and each year 1960-79-----	1-55
1-33. Estimated birth rates for married women by age of mother and race: United States, 1950, 1955, and 1960-79 ---	1-57
1-34. Estimated number and ratio of births to unmarried women, by age of mother and race: United States, 1979 -----	1-58
1-35. Estimated number and ratio of births to unmarried women, by live-birth order and race: United States, 1979 -----	1-59
1-36. Ratio of births to unmarried women to total live births by race: 39 reporting States and the District of Columbia, 1979 -----	1-59
1-37. Number and percent distribution of live births by attendant and place of delivery, by race: United States, specified years 1940-60 and each year 1965-79 -----	1-60
1-38. Percent distribution of live births by attendant and place of delivery, by color: United States, each division and State, 1979 -----	1-61
1-39. Median birth weight and percent distribution of live births by birth weight, by age of mother and race: United States, 1979 -----	1-62
1-40. Median birth weight by age of mother, live-birth order, and race: United States, 1979 -----	1-63
1-41. Median birth weight and percent distribution of live births by birth weight, by race for the United States and each geographic division; and by plurality for the United States: 1979 -----	1-64
1-42. Median birth weight and percent distribution of live births by birth weight, by period of gestation and race: Total of 47 reporting States and the District of Columbia, 1979-----	1-65
1-43. Number and percent distribution of live births by birth weight, by month of pregnancy prenatal care began and race: Total of 49 reporting States and the District of Columbia, 1979-----	1-66
1-44. Percent distribution of live births by month of pregnancy prenatal care began, by age of mother, race, and live-birth order: Total of 49 reporting States and the District of Columbia, 1979-----	1-67
1-45. Percent distribution of live births by month of pregnancy prenatal care began, by educational attainment of mother and race: Total of 46 reporting States and the District of Columbia, 1979-----	1-69

Table	Page
1-46. Number and percent distribution of live births by month of pregnancy prenatal care began, by marital status of mother and race: Total of 39 reporting States and the District of Columbia, 1979 -----	1-69
1-47. Birth rates: United States, each division and State, 1970-79 -----	1-70
1-48. Live births and birth rates for the 50 largest standard metropolitan statistical areas in the United States and their component counties: 1979 -----	1-71
1-49. Live births by State of occurrence distributed according to resident status: United States and each State, 1979 ----	1-73
1-50. Live births by month and State of occurrence: United States and each State, 1979 -----	1-76
1-51. Live births by month and race for the United States and each State; and by sex for the United States: 1979 -----	1-77
1-52. Live births by month, age of mother, live-birth order, and race: United States, 1979 -----	1-80
1-53. Live births by specified race or national origin and sex: United States, each division and State, 1979 -----	1-82
1-54. Live births by age of mother, live-birth order, sex of child, and race: United States, 1979 -----	1-83
1-55. Live births by age of father, age of mother, sex of child, and race: United States, 1979 -----	1-85
1-56. Live births by age of mother, live-birth order, and race: Each State, 1979 -----	1-86
1-57. Live births by single year of age of mother, live-birth order, and race: United States, 1979 -----	1-103
1-58. Live births by age of mother and race, for metropolitan and nonmetropolitan counties: United States and each State, 1979 -----	1-105
1-59. Live births by age of mother and race, for standard metropolitan statistical areas of the United States: 1979 -----	1-111
1-60. Live births by age of mother and race, for cities of 100,000 or more in the United States: 1979 -----	1-121
1-61. Live births by live-birth order and race for metropolitan and nonmetropolitan counties: United States and each State, 1979 -----	1-128
1-62. Live births by live-birth order and race, for standard metropolitan statistical areas of the United States: 1979. -----	1-134
1-63. Live births by place of birth of mother, age of mother, and race, for metropolitan and nonmetropolitan counties and for population-size groups in metropolitan counties: United States and each region, 1979 -----	1-144
1-64. Live births by interval since last live birth, live-birth order, age of mother, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-154
1-65. Live births by plurality of birth and race: United States and each State, 1979 -----	1-158
1-66. Live births by educational attainment of mother and father, and race: Total of 46 reporting States and the District of Columbia, 1979 -----	1-159
1-67. Live births by educational attainment of mother, age of mother, live-birth order, and race, for metropolitan and nonmetropolitan counties: Total of 46 reporting States and the District of Columbia, 1979 -----	1-160
1-68. Live births by educational attainment of father, age of father, and race: Total of 46 reporting States and the District of Columbia, 1979. -----	1-169
1-69. Live births by educational attainment of mother and race: 46 reporting States and the District of Columbia, 1979 -----	1-170
1-70. Live births by educational attainment of mother and race, for standard metropolitan statistical areas: 46 reporting States and the District of Columbia, 1979 -----	1-173

Table	Page
1-71. Births to unmarried women by age of mother, live-birth order, and race, for metropolitan and nonmetropolitan counties: Total of 39 reporting States and the District of Columbia, 1979 -----	1-181
1-72. Births to unmarried women by age of mother and race, for population-size groups and specified urban places of 50,000 or more: 39 reporting States and the District of Columbia, 1979 -----	1-183
1-73. Live births by marital status of mother, educational attainment of mother, age of mother, and race: Total of 38 reporting States and the District of Columbia, 1979 -----	1-197
1-74. Number of births to unmarried women by age of mother and race, and ratios by race for standard metropolitan statistical areas: 39 reporting States and the District of Columbia, 1979 -----	1-198
1-75. Live births by birth weight, plurality of birth, race, and sex: United States, 1979 -----	1-204
1-76. Live births by birth weight, age of mother, plurality of birth, and race: United States, 1979 -----	1-205
1-77. Live births by birth weight and race: United States and each State, 1979 -----	1-207
1-78. Percent of live births weighing less than 2,500 grams, by interval since last live birth, live-birth order, age of mother, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-210
1-79. Percent of live births weighing less than 2,500 grams, by outcome of last pregnancy, interval since termination of last pregnancy, live-birth order, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-214
1-80. Selected birth weight characteristics of live births by educational attainment of mother, age of mother, and race: Total of 46 reporting States and the District of Columbia, 1979 -----	1-217
1-81. Percent of live births weighing less than 2,500 grams by marital status of mother, age of mother, live-birth order, and race: Total of 39 reporting States and the District of Columbia, 1979 -----	1-219
1-82. Percent of live births weighing less than 2,500 grams by educational attainment of mother, month of pregnancy prenatal care began, and race: Total of 46 reporting States and the District of Columbia, 1979 -----	1-220
1-83. Live births by birth weight, period of gestation, and race, for metropolitan and nonmetropolitan counties: Total of 47 reporting States and the District of Columbia, 1979 -----	1-221
1-84. Live births by period of gestation, plurality of birth, and race, by sex of child and age of mother: Total of 47 reporting States and the District of Columbia, 1979 -----	1-223
1-85. Live births by period of gestation and race: 47 reporting States and the District of Columbia, 1979 -----	1-225
1-86. Live births by month of pregnancy prenatal care began and race: 49 reporting States and the District of Columbia, 1979 -----	1-227
1-87. Live births by number of prenatal visits, age of mother, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-230
1-88. Live births by number of prenatal visits, live-birth order, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-230
1-89. Live births by number of prenatal visits, educational attainment of mother, and race, for population-size groups in metropolitan and nonmetropolitan counties: Total of 46 reporting States and the District of Columbia, 1979 -----	1-231
1-90. Live births by number of prenatal visits, birth weight, and race: Total of 47 reporting States and the District of Columbia, 1979 -----	1-233
1-91. Live births by number of prenatal visits, month of pregnancy prenatal care began, marital status of mother, and race: Total of 39 reporting States and the District of Columbia, 1979 -----	1-234
1-92. Live births by 1-minute Apgar score, 5-minute Apgar score, and race: Total of 40 reporting States, 1979 -----	1-235

Table	Page
1-93. Live births by 1-minute Apgar score and race: 41 reporting States, 1979-----	1-236
1-94. Live births by 5-minute Apgar score and race: 40 reporting States and the District of Columbia, 1979 -----	1-238
1-95. Live births by 1- and 5-minute Apgar scores, by age of mother and race: Total of reporting areas, 1979-----	1-240
1-96. Live births by 1- and 5-minute Apgar scores, by live-birth order and race: Total of reporting areas, 1979 -----	1-241
1-97. Live births by 1- and 5-minute Apgar scores, by educational attainment of mother and race: Total of reporting areas, 1979 -----	1-242
1-98. Live births by 1- and 5-minute Apgar scores, by month of pregnancy prenatal care began and race: Total of reporting areas, 1979 -----	1-243
1-99. Live births by 1- and 5-minute Apgar scores, by birth weight and race: Total of reporting areas, 1979-----	1-244
1-100. Live births by 1- and 5-minute Apgar scores, by plurality of birth, sex of child, and race: Total of reporting areas, 1979 -----	1-245
1-101. Live births by 1- and 5-minute Apgar scores, by age and marital status of mother and race: Total of reporting areas, 1979 -----	1-246

SECTION 1 — NATALITY

Table 1-2. Registered Live Births and Birth Rates, by Race: Birth-Registration States, 1915-32, and United States, 1933-59

[Rates per 1,000 population residing in area for specified group except as noted. For data for succeeding years see table 1-1]

Area and year	Number				Rate ¹			
	All races	White	All other		All races	White	All other

³Based on a 50-percent sample of births.
⁴Based on a 20- to 50-percent sample of births.
⁵Figures by race exclude data for residents of New Jersey; see Technical Appendix.
⁶For method of adjustment, see Technical Appendix.

Table 1-4. Gross and Net Reproduction Rates by Color: United States, 1940-79

[Gross reproduction rates are the sums of birth rates by 5-year age groups of mothers multiplied by 5 and by the proportion of births that were female. These rates represent the average number of daughters that a hypothetical cohort of women born on the same date would bear if they all survived from birth to the end of the childbearing period and if they experienced a given set of age-specific fertility rates. Net reproduction rates are the sums of birth rates by 5-year age groups of mothers multiplied by 5 and by the probability (as determined from the life table for the year) of women surviving to a specified age group and by the proportion of births that were female. These rates represent the average number of daughters that a hypothetical cohort of 1,000 women would bear if they experienced given sets of age-specific mortality and fertility rates]

¹Rates computed by relating total births, regardless of age of father, to men aged 15-54 years.

²Rates computed by relating births to fathers under 20 years of age to men aged 15-19 years.

³Beginning 1970 excludes births to nonresidents of the United States; see Technical Appendix.

⁴Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix.

⁵Based on a 50-percent sample of births.

⁶For method of adjustment, see Technical Appendix.

⁷Figures exclude data for residents of New Jersey; see Technical Appendix.

SECTION I — NATALITY

1-15

Table 1-8. Birth Rates by Live-Birth Order and Race: United States, Specified Years 1940-55 and Each Year 1960-79

[Rates are live births per 1,000 women aged 15-44 years in specified racial group. Live-birth order refers to number of children born alive to mother]

¹Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix.
²Based on a 50-percent sample of births.
³Based on a 20- to 50-percent sample of births.

SECTION I — NATALITY

Table 1-12. Birth Probabilities by Parity, Exact Age, and Color: United States, Specified Years 1940-65 and Each Year 1970-79

[Based on births adjusted for underregistration and numbers of women adjusted for underenumeration and misstatements of age in the censuses. Parity refers to the number of children ever borne alive by a woman. Probabilities are the number of births per 1,000 women in specified parity and exact age group. Figures in the "0 parity" column show the probability of first births to "0 parity" women, those in the "1 parity" column show the probability of second births to "1 parity" women, etc.]

SECTION 1 — NATALITY

1-39

Table 1-17. Percent Distribution of Women by Parity, by Exact Age, and Color, for Women in Each Cohort From 1930 to 1965: United States, 1980

[Parity refers to the number of children ever borne alive by a woman as of a particular time. Based on cumulative birth rates. For method of computation, see Technical Appendix]

Cohort, exact age of woman, and color as of January 1, 1980	Total	Parity							
		0	1	2	3	4	5	6	7 or higher

SECTION 1 — NATALITY

Table 1-23. Birth Rates and Fertility Rates by Month, Adjusted for Seasonal Variation: United States, 1970-79

[Excludes births to nonresidents of the United States; see Technical Appendix. Monthly birth and fertility rates adjusted for seasonal variation are those that would have been observed if the characteristic seasonal pattern of births prevailing over the preceding 10 years were eliminated. Rates on an annual basis per 1,000 estimated population for specified month. Birth rates based on total population; fertility rates based on women aged 15-44 years. For method of seasonal adjustment see Technical Appendix]

¹Includes races other than white and black.

²Excludes births with birth order not stated and interval not stated.

SECTION 1 — NATALITY

Table 1-28. Mean Interval Since Termination of Last Pregnancy by Outcome of Last Pregnancy, Live-Birth Order, Age of Mother, and Race: Total of 47 Reporting States and the District of Columbia, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Refers only to births resulting from second and higher order pregnancies. For a listing of reporting areas see Technical Appendix, table A. Live-birth order refers to number of children born alive to mother. Mean interval in months. Excludes births with an interval of zero months (plural births)]

Outcome of last pregnancy, live-birth order, and race	Total	Age of mother					
		Under 20 years	20-24 years	25-29 years	30-34 years	35-39 years	40 years and over

SECTION 1 — NATALITY

Table 1-31. Estimated Number and Ratio of Births to Unmarried Women, by Race: United States, 1940-79

[Births to unmarried women are estimated for the United States from data for registration areas in which marital status of mother is reported. Due to rounding estimates to the nearest hundred, figures by race may not add to totals. Ratios per 1,000 total live births in specified group. Beginning in 1970 excludes births to nonresidents of the United States; see Technical Appendix]

¹Rates computed by relating total births to unmarried women, regardless of age of mother, to unmarried women aged 15-44 years.
²Rates computed by relating births to unmarried women aged 40 years and over to unmarried women aged 40-44 years. Rates by color for years prior to 1969 are computed by relating births to unmarried women aged 35 years and over to unmarried women aged 35-44 years.
³Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix.
⁴Based on a 50-percent sample of births.
⁵Based on a 20- to 50-percent sample of births.

SECTION 1 — NATALITY

Table 1-33. Estimated Birth Rates for Married Women by Age of Mother and Race: United States, 1950, 1955, and 1960-79

[Rates are live births to married women per 1,000 married women in specified group. Births to married women are estimated for the United States from data for registration areas in which marital status of mother is reported. Beginning 1970 excludes births to nonresidents of the United States; see Technical Appendix]

¹In 1977 and prior years includes all births in hospitals or institutions and births attended by physicians in clinics. Beginning in 1978 includes all births in clinics, regardless of attendant. A very large proportion of these births are attended by physicians; see Technical Appendix.

²Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix.

³Based on a 50-percent sample of births.

⁴Based on a 20- to 50-percent sample of births.

¹Computed to nearest 10 grams on basis of exact conversion of interval limits from pounds and ounces.

²Equivalents of the gram weights in terms of pounds and ounces are shown in the Technical Appendix.

SECTION 1 — NATALITY

Table 1-42. Median Birth Weight and Percent Distribution of Live Births by Birth Weight, by Period of Gestation and Race: Total of 47 Reporting States and the District of Columbia, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Figures by period of gestation are based on an item on the birth record, first day of last normal menstrual period (LMP); see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Based only on cases for which birth weight is stated]

Period of gestation and race	Median weight in grams ¹	Percent distribution by birth weight ²

¹Computed to nearest 10 grams on basis of exact conversion of interval limits from pounds and ounces.

²Equivalents of the gram weights in terms of pounds and ounces are shown in the Technical Appendix.

³Births with period of gestation of less than 20 weeks and not stated are included in the totals but not shown separately.

⁴Includes races other than white and black.

SECTION 1 — NATALITY

Table 1-43. Number and Percent Distribution of Live Births by Birth Weight, by Month of Pregnancy Prenatal Care Began and Race: Total of 49 Reporting States and the District of Columbia, 1979

SECTION 1 — NATALITY

Table 1-48. Live Births and Birth Rates for the 50 Largest Standard Metropolitan Statistical Areas in the United States and Their Component Counties: 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Standard metropolitan statistical areas are those defined by the Office of Federal Statistical Policy and Standards for 1979 except for New England, where areas are 1970 metropolitan State economic areas defined by the Bureau of the Census. For further discussion of areas, see Technical Appendix. Rates are live births per 1,000 population]

SECTION 1 — NATALITY

Table 1-56. Live Births by Age of Mother, Live-Birth Order, and Race: Each State, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Live-birth order refers to number of children born alive to mother]

Area, age of mother, and race ¹	Total	Live-birth order

SECTION 1 — NATALITY

Table 1-62. Live Births by Live-Birth Order and Race, for Standard Metropolitan Statistical Areas of the United States: 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Live-birth order refers to number of children born alive to mother. Standard metropolitan statistical areas are those defined by the Office of Management and Budget for 1970 except for New England, where areas are 1970 metropolitan State economic areas defined by the Bureau of the Census. For further discussion of areas see Technical Appendix]

SECTION 1 — NATALITY

I-173

Table 1-70. Live Births by Educational Attainment of Mother and Race, for Standard Metropolitan Statistical Areas: 46 Reporting States and the District of Columbia, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. SMSA's are those defined by the Office of Management and Budget for 1970 except for New England, where areas are 1970 metropolitan State economic areas defined by the Bureau of the Census. For further discussion of SMSA's see Technical Appendix]

SECTION I — NATALITY

Table 1-74. Number of Births to Unmarried Women by Age of Mother and Race, and Ratios by Race for Standard Metropolitan Statistical Areas: 39 Reporting States and the District of Columbia, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. SMSA's are those defined by the Office of Management and Budget for 1970 except for New England, where areas are 1970 metropolitan State economic areas defined by the Bureau of the Census. For further discussion of SMSA's see Technical Appendix]

Area and race ¹	Total, all ages	Number of births to unmarried women by age of mother							Ratio per 1,000 live births
		Under 15 years	15-19 years	20-24 years	25-29 years	30-34 years	35-39 years	40 years and over

SECTION 1 — NATALITY

Table 1-78. Percent of Live Births Weighing Less Than 2,500 Grams, by Interval Since Last Live Birth, Live-Birth Order, Age of Mother, and Race: Total of 47 Reporting States and the District of Columbia, 1979—Con.

[See headnote at beginning of table]

Table with 8 main columns: Interval since last live birth, live-birth order, and race; Total; Age of mother (Under 20 years, 20-24 years, 25-29 years, 30-34 years, 35-39 years, 40 years and over). Rows are categorized by race (WHITE-Con., BLACK) and birth order (Seventh, Births of eighth or higher order, All births of second and higher order, Second, Third, Fourth, Fifth). Each row lists intervals from 0 months to 72 months and over, with a 'Not stated' category. Percentages are provided for each cell, with some values marked with an asterisk.

See footnotes at end of table.

SECTION 1 — NATALITY

Table 1-78. Percent of Live Births Weighing Less Than 2,500 Grams, by Interval Since Last Live Birth, Live-Birth Order, Age of Mother, and Race: Total of 47 Reporting States and the District of Columbia, 1979—Con.

SECTION 1 — NATALITY

Table 1-79. Percent of Live Births Weighing Less Than 2,500 Grams, by Outcome of Last Pregnancy, Interval Since Termination of Last Pregnancy, Live-Birth Order, and Race: Total of 47 Reporting States and the District of Columbia, 1979—Con.

[See headnote at beginning of table]

Interval since termination of last pregnancy, live-birth order, and race	All second and higher order pregnancies	Outcome of last pregnancy		
		Last pregnancy, live birth	Last pregnancy, fetal death	Last pregnancy, outcome unknown
BLACK—Con.				
Second live births by interval since last pregnancy -----	12.1	11.7	13.1	14.7
0 months (plural deliveries) -----	69.0	69.2	*37.5	-
1-11 months -----	28.3	31.3	21.8	*57.1
12-17 months -----	13.8	14.2	12.4	-
18-23 months -----	10.7	10.6	11.4	*16.7
24-35 months -----	10.1	10.0	11.9	*33.3
36-47 months -----	9.8	9.8	9.9	*8.3
48-59 months -----	9.3	9.2	12.6	*50.0
60 months and over -----	9.4	9.3	11.3	*21.4
Not stated -----	14.3	13.6	-	14.7
Third live births by interval since last pregnancy -----	12.4	11.8	13.5	15.9
0 months (plural deliveries) -----	61.9	61.9	*61.5	*100.0
1-11 months -----	26.6	28.4	21.8	-
12-17 months -----	12.9	13.1	12.0	-
18-23 months -----	10.5	10.3	12.0	*20.0
24-35 months -----	9.8	9.6	12.3	*25.0
36-47 months -----	9.6	9.4	12.0	-
48-59 months -----	8.9	8.6	16.1	-
60 months and over -----	9.4	9.4	10.4	*18.2
Not stated -----	15.1	13.3	-	15.8
Fourth live births by interval since last pregnancy -----	13.4	13.0	13.2	16.5
0 months (plural deliveries) -----	59.5	59.5	*66.7	-
1-11 months -----	26.4	28.9	19.3	-
12-17 months -----	12.8	13.0	11.5	*25.0
18-23 months -----	11.6	11.3	13.9	-
24-35 months -----	9.9	9.7	12.7	*33.3
36-47 months -----	9.6	9.4	11.7	-
48-59 months -----	10.6	10.7	8.2	-
60 months and over -----	9.7	9.7	11.2	-
Not stated -----	16.1	14.8	-	16.5
Live births of fifth and higher order by interval since last pregnancy -----	13.6	13.2	15.5	15.9
0 months (plural deliveries) -----	55.1	55.0	*75.0	*100.0
1-11 months -----	26.3	27.4	21.8	-
12-17 months -----	12.6	12.4	14.1	-
18-23 months -----	8.9	8.8	10.2	-
24-35 months -----	10.9	10.8	13.0	-
36-47 months -----	11.4	11.2	14.8	-
48-59 months -----	11.3	11.0	19.1	-
60 months and over -----	11.3	11.0	23.1	-
Not stated -----	15.4	14.0	-	16.0

¹Includes races other than white and black.
²Excludes not stated birth order.

SECTION 1 — NATALITY

1-217

Table 1-80. Selected Birth Weight Characteristics of Live Births by Educational Attainment of Mother, Age of Mother, and Race: Total of 46 Reporting States and the District of Columbia, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Median weight in grams computed to the nearest 10 grams on basis of exact conversion of interval limits from pounds and ounces. The equivalent of 2,500 grams is 5 lb 8 oz]

Selected birth weight characteristics, age of mother, and race	Total	Years of school completed by mother					
		0-8 years	9-11 years	12 years	13-15 years	16 years or more	Not stated

SECTION 1 — NATALITY

Table 1-95. Live Births by 1- and 5-Minute Apgar Scores, by Age of Mother and Race: Total of Reporting Areas, 1979 [Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Apgar score is a summary indicator of the baby's clinical condition]

Table with columns for Apgar score (0-10, Not stated) and rows for 1-Minute Apgar Score and 5-Minute Apgar Score, categorized by race (All races, White, Black) and age groups (Under 15 years to 45-49 years). Total values are provided for each major category.

1Data are for 41 reporting States. 2Includes races other than white and black. 3Data are for 40 reporting States and the District of Columbia.

SECTION I — NATALITY

Table 1-97. Live Births by 1- and 5-Minute Apgar Scores, by Educational Attainment of Mother and Race: Total of Reporting Areas, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Apgar score is a summary indicator of the baby's clinical condition]

SECTION 1 — NATALITY

Table 1-100. Live Births by 1- and 5-Minute Apgar Scores, by Plurality of Birth, Sex of Child, and Race: Total of Reporting Areas, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Apgar score is a summary indicator of the baby's clinical condition]

¹Data are for 41 reporting States.

²Includes races other than white and black.

³Data are for 40 reporting States and the District of Columbia.

SECTION 1 — NATALITY

Table 1-101. Live Births by 1- and 5-Minute Apgar Scores, by Age and Marital Status of Mother and Race: Total of Reporting Areas, 1979

[Based on 100-percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. For a listing of reporting areas see Technical Appendix, table A. Figures for marital status not stated or not reported are included in births to married women. Apgar score is a summary indicator of the baby's clinical condition.]

¹Data are for 34 reporting States.

²Data are for 34 reporting States and the District of Columbia.

³Includes races other than white and black.

Section 2. Local Area Statistics

Table		Page
2-1.	Live births by place of delivery and race: United States, each State and county, and specified urban places of 10,000 or more, 1979 -----	2-3
2-2.	Live births by attendant and place of delivery and by birth weight, by race, for population-size groups in metropolitan and nonmetropolitan counties: United States and each State, 1979 -----	2-72

SECTION 2 — LOCAL AREA STATISTICS

Table 2-1. Live Births by Place of Delivery and Race: United States, Each State and County, and Specified Urban Places of 10,000 or More, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Small figures should be used with caution; for sampling errors see Technical Appendix. Urban places are those with populations of 10,000 or more in 1970 and are incorporated unless otherwise noted. Figures for "Black" are shown separately for those counties and urban places in which the 1970 populations for the "All other" group formed 10 percent of the total population of the area or numbered 10,000 or more]

SECTION 2 — LOCAL AREA STATISTICS

Table 2-1. Live Births by Place of Delivery and Race: United States, Each State and County, and Specified Urban Places of 10,000 or More, 1979—Con.

[See headnote at beginning of table]

Table with columns for Area and race, Total births by county of occurrence, Births by place of residence (Total births, Place of delivery: In hospital, Not in hospital and not specified), and Births by place of residence (Total births, Place of delivery: In hospital, Not in hospital and not specified). Rows list various counties and urban areas like North Carolina, Alamance, Burlington, etc., with racial breakdowns (White, All other, Black).

See footnotes at end of table.

Table 2-1. Live Births by Place of Delivery and Race: United States, Each State and County, and Specified Urban Places of 10,000 or More, 1979—Con. [See headnote at beginning of table]

Table with 9 main columns: Area and race, Total births by county of occurrence, Births by place of residence (Total births, Place of delivery: In hospital, Not in hospital and not specified), Area and race, Total births by county of occurrence, Births by place of residence (Total births, Place of delivery: In hospital, Not in hospital and not specified). Rows include various counties in Ohio, such as Allen, Ashland, Ashtabula, Athens, Auglaize, Belmont, Brown, Butler, Champaign, Clark, Clermont, Clinton, Columbiana, Coshocton, Crawford, Cuyahoga, Euclid, Hamilton, etc.

See footnotes at end of table.

#Classified as urban under special rule; see Technical Appendix.

¹Includes all births in hospitals, institutions, and clinics; see Technical Appendix.

²"Districts" shown are election districts, the nearest equivalent of counties.

³Includes data for Texarkana, Ark., only.

⁴The cities of Honolulu and Hilo have legally established limits and, therefore, are treated as incorporated places.

⁵Includes data for Bristol, Tenn., only.

⁶Includes data for Texarkana, Tex., only.

⁷On January 1, 1974, Nansmond merged with the independent city of Suffolk.

⁸Independent cities having populations of less than 10,000 according to the 1970 census are Bedford, Buena Vista, Clifton Forge, Emporia, Franklin, Galax, Lexington, Norton, South Boston, Suffolk, and Williamsburg.

⁹Includes data for Bristol, Va., only.

¹⁰Includes data for Bluefield, W. Va., only.

SECTION 2 — LOCAL AREA STATISTICS

Table 2-2. Live Births by Attendant and Place of Delivery and by Birth Weight, by Race, for Population-Size Groups in Metropolitan and Nonmetropolitan Counties: United States and Each State, 1979

[Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see Technical Appendix. Urban places in metropolitan counties are those with populations of 10,000 or more; urban places in nonmetropolitan counties are those with populations of 10,000 or more but less than 50,000. For definition of areas see Technical Appendix]

¹Totals for geographic areas include races other than white and black.

²Births attended by other and not specific persons outside of hospitals are not shown separately but are included in total births. For the United States, these births totaled 11,714 in 1979.

³Includes all births in hospitals, institutions, and clinics. A very large proportion of these births are attended by physicians; see Technical Appendix.

⁴Equivalent of 2,500 grams is 5 lb 8 oz.

⁵Includes data for Middletown Township (Monmouth County), New Jersey, which had a 1970 population of 54,623. Monmouth County is not designated as metropolitan.

⁶County equivalents.

Section 3. Puerto Rico, the Virgin Islands (U.S.), and Guam

Table	Page

3-2. Live births by month for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 ----	3-3
3-3. Live births by age of mother and live-birth order for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-4
3-4. Live births by age of father and sex of child for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-5
3-5. Live births by age of mother and educational attainment of mother: Puerto Rico, Virgin Islands, and Guam, 1979 ----	3-6
3-6. Live births by live-birth order and educational attainment of mother: Puerto Rico, Virgin Islands, and Guam, 1979----	3-7
3-7. Number and ratio of births to unmarried women, by age of mother for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-8
3-8. Median birth weight and live births by birth weight for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-9
3-9. Live births by month of pregnancy prenatal care began and birth weight for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-9
3-10. Live births by place of delivery: Puerto Rico and each municipio, 1979 -----	3-10
3-11. Live births by place of delivery and race: Virgin Islands by Island and specified urban place, and Guam, 1979 ----	3-11
3-12. Live births by period of gestation for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979-----	3-11
3-13. Live births by number of prenatal visits for Puerto Rico, Virgin Islands, and Guam; and by race for Virgin Islands and Guam: 1979 -----	3-12
3-14. Live births by 1- and 5-minute Apgar scores for Puerto Rico and Guam; and by race for Guam: 1979-----	3-12

NOTES

Occurrence and residence allocation

Residence data for 1979 for the Commonwealth of Puerto Rico, the Virgin Islands, and Guam include only those births occurring within each of these areas to residents of each area respectively. Births occurring in Guam to residents of the United States are included with Guamanian resident births, since it has been determined that most of these births are to Armed Forces families, customarily considered residents of the area in which military installations are located. For 1966 and prior years births to nonresidents of Puerto Rico and the Virgin Islands were considered to be births to residents of the place of occurrence.

Data are shown by both place of occurrence and place of residence for Puerto Rico for the primary geographic subdivision, the "municipio," for the Virgin Islands for St. Croix Island and St. John and St. Thomas Islands, and for Guam as a whole.

Race

Births are not shown by race for Puerto Rico; they are classified as white, all other, and black for the Virgin Islands, and as white, all other, and Guamanian for Guam.

Completeness of registration

Data for Puerto Rico, the Virgin Islands, and Guam refer to registered births; no adjustment has been made for possible underreporting. Tests of birth-registration completeness made for Puerto Rico and the Virgin Islands in 1950 indicated that in that year registration was 95.9 percent complete in Puerto Rico and 100.0 percent complete in the Virgin Islands. No information on registration completeness is available for Guam.

The Technical Appendix, Section 4, discusses other factors concerning these natality statistics.

SECTION 3 — PUERTO RICO, VIRGIN ISLANDS, AND GUAM

3-3

SECTION 4 - TECHNICAL APPENDIX

DEFINITION OF LIVE BIRTH

Every product of conception that gives a sign of life after birth, regardless of the length of the pregnancy, is considered a live birth. This concept is embraced by the definition set forth by the World Health Organization¹ as follows:

Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered liveborn.

This definition distinguishes in precise terms a live birth from a fetal death (see section on fetal deaths in the Technical Appendix of volume II of this report). In the interest of comparable natality statistics, both the Statistical Commission of the United Nations and the National Center for Health Statistics have adopted this definition.^{2,3}

HISTORY OF BIRTH-REGISTRATION AREA

The national birth-registration area was proposed in 1850, established in 1915, and completed in 1933. The organized territories of Hawaii and Alaska were admitted in 1929 and 1950, respectively; data from these areas were prepared separately until they became States—Alaska in 1959 and Hawaii in 1960. At present the birth-registration system of the United States covers the 50 States, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, and Guam. However, in the statistical tabulations, *United States* refers only to the aggregate of the 50 States and the District of Columbia. Tabulations for Puerto Rico, the Virgin Islands, and Guam are shown separately in section 3 of this volume.

The original birth-registration area of 1915 consisted of 10 States and the District of Columbia. The growth of this area is indicated in table 4-1. This table also presents for each year through 1932 the estimated midyear population of the United States and of those States included in the registration system.

Because of the growth of the area for which data have been collected and tabulated, a national series of geographically comparable data prior to 1933 can be obtained only by estimation. Annual estimates of births have been prepared by P. K. Whelpton for the period 1909-34 (table 1-1). These estimates include adjustments for underregistration as well as for States not in the birth-registration area before 1933.

SOURCES OF DATA

Natality statistics

Natality statistics for 1979 are based on information from two sources. For all but eight States and the District of Columbia, statistics are based on information derived from computer data tapes coded by the States and provided to the National Center for Health Statistics (NCHS) through the vital statistics cooperative program. Data from these States are based on the total file of records. Statistics for the remaining States—Arizona, Arkansas, California, Delaware, Georgia, New Mexico, North Dakota, and South Dakota—and the District of Columbia are based on information obtained from a 50-percent sample of microfilm copies of all certificates of live birth filed in these States. The Center receives these tapes and microfilm copies from the registration offices of each State, the District of Columbia, and New York City.

Records from the Virgin Islands are received in the form of microfilm copies of birth certificates; those from Guam are received as photocopies of original birth certificates; and those from Puerto Rico are received as computer tapes through the vital statistics cooperative program. Natality data for 1979 for these areas are based on the total file of records. Before 1977 Puerto Rican records were

sampled on a 50-percent basis. Information for previous years for these three areas is published in the respective annual vital statistics reports of the Department of Health of the Commonwealth of Puerto Rico, the Department of Health of the Virgin Islands, the Department of Public Health and Social Services of the Government of Guam, and in selected *Vital Statistics of the United States* annual reports.

When the microfilmed data are received from the various registration offices, the information on the sampled microfilm records is coded onto magnetic tape for input to the electronic computer. The computer then edits all the taped records and produces tabulations of natality statistics that are adjusted for sampling factors.

Natality data for the United States are limited to births occurring within the United States, including those occurring to residents and nonresidents of the United States. However, births to nonresidents of the United States are excluded from all tabulations by place of residence beginning in 1970. (See section on Classification by occurrence and residence for further discussion.) Births occurring to U.S. citizens outside the United States are not included in any tabulations in this report. Similarly the data for Puerto Rico, the Virgin Islands, and Guam are limited to births registered in these areas.

Standard Certificate of Live Birth

The Standard Certificate of Live Birth, issued by the Public Health Service, has served for many years as the principal means of attaining uniformity in the content of the documents used to collect information on births in the United States. It has been modified in each State to the extent required by the particular needs of the State or by special provisions of the State vital statistics law. However, the certificates of most States conform closely in content to the standard certificate.

The first issue of the standard certificate of birth appeared shortly before the formation of the registration area in 1915. Since then it has been revised periodically by the national vital statistics agency through consultation with State health officers and registrars; Federal agencies concerned with vital statistics; national, State, and county medical societies; and others working in the fields of public health, social welfare, demography, and insurance. This revision procedure has assured careful evaluation of each item in terms of its current and future usefulness for registration, identification, legal, medical, and research purposes. New items have been added when necessary, and old items have been modified to ensure better reporting or in some cases have been dropped when their usefulness appeared to be limited.

1978 revision.—Effective January 1, 1978, a revised Standard Certificate of Live Birth (figure 4-A)

replaced the 1968 revision. Changes on the new standard certificate include the addition of a new item on 1- and 5-minute Apgar scores, the deletion of the item on birth injuries, and revisions of the items on legitimacy status and previous pregnancies.

The item on legitimacy status has been changed to read "Is Mother Married?" This is now a factual piece of information about the mother rather than an attribute ascribed to the child, and it removes from the person completing the record the responsibility for making what may be a legal determination.

The item on previous deliveries has been changed to pregnancy history and expanded to include two categories of fetal loss, that before and that after 20 completed weeks of gestation. This change provides information on two groups which are of interest in medical research and emphasizes the fact that all previous fetal losses should be included, both spontaneous and induced, regardless of length of gestation. For further discussion see individual headings for each item.

CLASSIFICATION OF DATA

The principal value of vital statistics data is realized through the presentation of rates which are computed by relating the vital events of a class to the population of a similarly defined class. Vital statistics and population statistics must therefore be classified according to similarly defined systems and tabulated in comparable groups. Even when the variables common to both, such as geographic area, age, race, and sex, have been similarly classified and tabulated, differences between the enumeration method of obtaining population data and the registration method of obtaining vital statistics data may result in significant discrepancies.

The general rules used to classify geographic and personal items for live births are set forth in "Vital Statistics Classification and Coding Instructions for Live Birth Records, 1979," *NCHS Instruction Manual*, Part 3a. The classification of certain important items is discussed on the following pages.

Classification by occurrence and residence

Tabulations for States and other areas within the United States are by place of residence unless otherwise specified in the tables. Births to U.S. residents occurring outside this country are not reallocated to the United States. In tabulations by place of residence, births occurring within the United States to U.S. citizens and to resident aliens are allocated to the usual place of residence of the mother in the United States as reported on the birth certificate. Beginning in 1970, births to nonresidents of the

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE—PUBLIC HEALTH SERVICE—NATIONAL CENTER FOR HEALTH STATISTICS
1978 REVISION

HRA-161
Rev. 1/78

United States occurring in the United States are excluded from these tabulations. From 1966 to 1969, births occurring in the United States to mothers who were nonresidents of the United States were considered as births to residents of the exact place of occurrence; in 1964 and 1965 all such births were allocated to "balance of county" of occurrence even if the birth had occurred in a city.

The change in coding beginning in 1970 to exclude births to nonresidents of the United States from residence data significantly affects the comparability of data with years prior to 1970 only for Texas;

in 1979, 76.2 percent of the 5,397 births to nonresidents of the United States occurred in this State. In 1979 births to residents of Mexico constituted 90.0 percent of all nonresident births in the United States. No evaluation of the effect of the change in procedure between 1965 and 1966 has been made:

For the total United States the tabulations by place of residence and by place of occurrence are not identical. Births to nonresidents of the United States are included in data by place of occurrence but excluded from data by place of residence, as previously indicated.

In volumes for 1969-77 individual State totals varied from table to table for those tables showing items not reported by all States. These differences occurred when a resident of a State reporting a certain item had a birth in a nonreporting State. The birth was not included in tables showing data for that item for the State of residence. However, beginning with 1978, births to residents of a reporting State are included in the table regardless of whether they occurred in a reporting or a nonreporting State. As a result, the total number of births by residence for a State is the same in all tables. In addition, there is a slight increase in the "Not stated" category due to the inclusion of births to residents of reporting States that occurred in nonreporting States.

Residence error.—A nationwide test of birth-registration completeness in 1950 provided measures of residence error for natality statistics. According to this test, errors in residence reporting for the country as a whole tend to overstate the number of births to residents of urban areas and to understate the number to residents of other areas. This tendency has assumed special importance because of a concomitant development—the increased utilization of hospitals in cities by residents of nearby places—with the result that a number of births are erroneously reported as having occurred to residents of urban areas. Another factor which contributes to this overstatement of urban births is the customary procedure of using "city" addresses for persons living outside the city limits.

Incomplete residence.—Beginning in 1973 where only the State of residence is reported with no city or county specified, and the State named is different from the State of occurrence, the birth is allocated to the largest city of the State of residence. Before 1973 such births were allocated to the exact place of occurrence.

Geographic classification

The rules followed in the classification of geographic areas for live births are contained in the instruction manual mentioned previously. The geographic code structure for 1979 is given in another manual entitled "Geographic Codes" (revised January 1970).

United States.—In the statistical tabulations, "United States" refers only to the aggregate of the 50 States and the District of Columbia. Alaska has been included in the U.S. tabulations since 1959 and Hawaii since 1960.

Standard metropolitan statistical areas.—The standard metropolitan statistical areas (SMSA's) used in all but one table in this report are those established for 1970 by the U.S. Office of Management and Budget and used by the U.S. Bureau of the Census except in the New England States. In table 1-48, section 1, the SMSA's are those established for 1979.

Except in the New England States an SMSA is a county or a group of contiguous counties containing at least one city of 50,000 inhabitants or more or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to specified criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city or cities.^{4,5}

In the New England States the Office of Management and Budget uses towns and cities rather than counties as geographic components of SMSA's. The National Center for Health Statistics cannot, however, use the SMSA classification for these States because its data are not coded to identify all towns. Instead, the metropolitan State economic areas (MSEA's) are used. These areas are established by the Bureau of the Census and are made up of county units.^{4,6}

Standard consolidated areas.—For the metropolitan complexes around New York and Chicago, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria for SMSA's but do have strong interrelationships of other kinds have been combined into the New York-North-eastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas.^{4,5}

Metropolitan and nonmetropolitan counties.—Independent cities and counties included in SMSA's or in New England MSEA's are included in data for metropolitan counties; all other counties are classified as nonmetropolitan.

Population-size groups.—Beginning in 1970 vital statistics data for cities and certain other urban places are classified according to the population enumerated in the 1970 Census of Population. Classification of such areas into population-size groups for 1960-69 was determined by the population enumerated in the 1960 Census of Population. Beginning in 1964, cities and other urban places of 2,500 to 10,000 population have not been separately identified but are included with the areas formerly classified as rural. Data continue to be available for the individual cities and other urban places of 10,000 or more population. As a result of changes in population between 1960 and 1970, some urban places identified in previous reports are no longer included, while a number of other places have been added. Data for the remaining areas not separately identified are shown in the tables under the heading "balance of area" or "balance of county."

Urban places other than incorporated cities for which vital statistics data are shown in this report include:

1. Each town in New England and each township in New Jersey and Pennsylvania that had no incorporated municipality as a subdivision and had either 25,000 inhabitants or more, or

a population of 10,000 to 25,000 and a density of 1,500 persons or more per square mile.

2. Each county in States other than the New England States, New Jersey, and Pennsylvania that had no incorporated municipality within its boundary and had a density of 1,500 persons or more per square mile. (Arlington County, Virginia, is the only county classified as urban under this rule.)

Race or national origin and color

Births in the United States in 1979 are classified for statistical purposes according to the race or national origin of the parents. The categories are "White," "Black," "American Indian," "Chinese," "Japanese," "Hawaiian," "Filipino," "Other Asian or Pacific Islander," and "Other." Before 1978 the category "Other Asian or Pacific Islander" was not identified separately but included with "Other" races. The separation of this category allows identification of the category "Asian or Pacific Islander" by combining the new category with Chinese, Japanese, Hawaiian, and Filipino.

The newborn child is ordinarily assigned to the race or national origin of the parents. If the parents are of different races or national origins, the following rules apply: (1) When only one parent is white, the child is assigned the other parent's race or national origin. (2) When neither parent is white, the child is assigned the father's race or national origin with one exception; if the mother is Hawaiian or part-Hawaiian, the child is assigned to Hawaiian. If race is missing for one parent, the child is assigned the race of the parent for whom race is given. When information on race is missing for both parents, the race of the child is considered not stated and the birth is allocated according to rules discussed in the section "Race or national origin not stated."

The terms "color," "race," and "specified race or national origin" indicate the detail of classification of this variable. Tabulations by "color" have two categories, "White" and "All other." Tabulations by "race" show data separately for the black population as well. Tabulations by "specified race or national origin" are the most detailed, showing all categories of the classification. In most tables the less detailed classifications of "color" and "race" are used.

White.—The category "White" comprises births reported as white, Mexican, Puerto Rican, Cuban, and, before 1964, all births for which race or national origin was not stated. Beginning in 1964 changes in the procedures for allocating race when race or national origin is not stated have changed the composition of this category. (See discussion on "Race or national origin not stated.")

All other.—The category "All other" comprises black, American Indian, Chinese, Japanese, Hawaiian and part-Hawaiian, Filipino, other Asian or Pacific

Islander including Asian Indian, and "Other." Before 1978 Asian Indian was included in the white category. Beginning in 1964, Aleuts and Eskimos are included in "American Indian," significantly increasing the births in this category when comparisons are made with previous years. Alaska is particularly affected in this regard. Before 1964, Aleuts and Eskimos were assigned to the "Other" category.

For all years except 1964 if the race or national origin of a parent was ill-defined or not clearly identifiable with one of the categories used in the classification, e.g., if "oriental" or "yellow" was entered, an attempt was made to determine the specific race by examining the entry for place of birth. If the birthplace was not China, Japan, or the Philippines, the parent's race was assigned to the category "Other." Beginning in 1978 the race was assigned to the category "Other Asian or Pacific Islander." In 1964 no place of birth inquiries were made and such cases were assigned to "Race or national origin not stated." As a result, the numbers of births classified as Chinese, Japanese, and "Other" in 1964 were smaller than they would have been under the procedure used in other years.

Since July 1, 1972, the birth certificate for Georgia does not provide for the specified race of the parents if the race is other than white or black. Cases for which it was indicated that parents were not of either of these races were assigned to the category "Other." This affects tabulations of births by specified race or national origin. It is reflected in an increase in births for the "Other" category and a concomitant decrease in births for American Indian, Chinese, Japanese, Other Asian or Pacific Islander, and Filipino. Although the exact number of births involved is not known, the number is small as there were only 150 births in these four racial groups in Georgia during 1971.

Race or national origin not stated.—The race of a child is considered not stated in those cases in which information for both parents is missing. Before 1964 all such cases were tabulated as white. From 1964 through 1968 the race of the child was allocated by the computer as follows: If the race on the preceding record was white, the assignment was to white; otherwise the assignment was to black. Beginning in 1969 the race of the child has been allocated electronically according to the specific race of the child on the preceding record. Consequently, some of the not stated frequencies which had previously been assigned to the black category may now be assigned to one of the other race or national origin categories.

Nearly all statistics by color and race or national origin for the United States as a whole in 1962 and 1963 are affected by a lack of information for New Jersey. Birth rates by color for those years are computed on a population base which excludes New Jersey. (For the method of estimating the United

States population by age, sex, and color excluding New Jersey in 1962 and 1963, see *Vital Statistics of the United States, 1963*, Volume I, page 4-8.) Estimates of births to unmarried mothers by color for the United States, which include special estimates for New Jersey for 1962 and 1963, have been prepared and are shown in table 1-31.

Completeness of registration by color.—The quality of birth data by color is variable in that birth registration is higher for the white group than for the all other group. In 1979 birth-registration completeness was estimated to be 99.5 percent for white births and 98.6 percent for all other births. The most recent figures for specified racial or national origin groups are from the 1950 birth-registration completeness test. In that year the registration completeness for black births was estimated to be 93.7 percent; for American Indians, 85.1 percent; and for others, including Chinese and Japanese, 97.4 percent. These figures are probably higher for 1979, but more precise estimates are unavailable.

Age of mother

The birth certificate asks for "Age (at time of this birth)." The age of mother is edited for upper and lower limits. When mothers are reported to be below 10 years of age or age 50 and over, the age of the mother is considered not stated and is assigned as described below.

Age-specific birth rates shown in this report are based on populations of women by age, which are prepared by the U.S. Bureau of the Census. In census years the census decennial counts are used. In intercensal years, estimates of the population of women by age are published in the *Current Population Reports* of the U.S. Bureau of the Census.

The 1970 Census of Population derived data on age from information requested on month and year of birth, which served as the basis for determining age in completed years as of April 1, 1970. Similarly, age was determined in the 1960 Census of Population from the question, "When was this person born?" and the replies were birth dates in terms of year and month. "Age in completed years" was asked in censuses before 1960. This was nearly the equivalent of the birth certificate question, which the 1950 matched test of birth and census records confirms by showing a high degree of consistency in the reporting of age in these two sources.⁷

Median age of mother.—Median age is the value which divides an age distribution into two equal parts, one-half of the values being less and one-half being greater. Median ages of mothers for 1960 to the present have been computed using birth rates for 5-year age groups rather than from birth frequencies. This method eliminates the effects of changes in the age composition of the childbearing population over

time. Changes in the median ages from year to year can thus be attributed solely to changes in the age-specific birth rates.

Not stated age of mother.—Beginning in 1964 birth records with age of mother not stated have been allocated according to the age appearing on the record previously processed for a mother of identical color and having the same total-birth order (total of fetal deaths and live births). In 1963 birth records with age not stated were allocated according to the age appearing on the record previously processed for a mother of identical color and parity (number of live births). For 1960-62 not stated and unknown ages were distributed in proportion to the known ages for each color group. Before 1960 this was done for age-specific birth rates but not for the birth frequency tables, which showed a separate category for age not stated.

Age of father

Age of father is coded as stated on the birth certificate. If the age is under 10 years, it is considered "not stated" and grouped with those cases for which age is not stated on the certificate. Information on age of father is usually missing on birth certificates of children born to unwed mothers, greatly inflating the number of "not stated" in all tabulations by age of father. In computing birth rates by age of father, births tabulated as age of father not stated are distributed in the same proportions as births with known age within each 5-year age classification of the mother. This procedure is done separately by race. The resulting distributions are summed to form a composite frequency distribution which is the basis for computing birth rates by age of father. This procedure avoids the distortion in rates which would result if the relationship between age of mother and age of father were disregarded.

Live-birth order and parity

Birth order and parity classifications shown in this volume refer to the total number of live births the mother has had, including the 1979 birth. Fetal deaths are excluded.

Birth order indicates what number the present birth represents, e.g., a baby born to a mother who has had two previous live births (even if one or both are not now living) has a birth order of three.

Parity indicates how many live births a mother has had. Before delivery a mother having her first baby has a parity of zero and a mother having her third baby has a parity of two. After delivery the mother of a baby who is a first live birth has a parity of one and the mother of a baby who is a third live birth has a parity of three.

Birth order and parity are ascertained from two items on the birth certificate, "Live births—now living" and "Live births—now dead."

Not stated birth order.—Before 1969 if both of these items were blank, the birth was considered a first birth. Beginning in 1969, births for which neither item was completed have been tabulated as birth order not stated. As a result of this revised procedure, 19,839 births in 1979 which would have been assigned to the “First birth order” category under the old rules were assigned to the “Not stated” category.

All births tabulated in the “Not stated birth order” category are excluded from the computation of percents. In computing birth rates by live-birth order, births tabulated as birth order not stated are distributed in the same proportion as births of known live-birth order.

Dates of last live birth and last fetal death

Date of last live birth and date of last fetal death were added to the Standard Certificate of Live Birth in 1968 for the purpose of providing information on child spacing and pregnancy intervals. Tabulations on these items were presented for the first time in 1969. In 1978 the wording of the item “date of last fetal death” was changed to “date of last other termination” to ensure inclusion of both spontaneous and induced fetal deaths. This information was obtained from 47 States and the District of Columbia in 1979 as indicated in table A.

Interval since last live birth and last fetal death.—Data on intervals since last live birth and last fetal death are computed from the date of birth, date of last live birth, and date of last fetal death. The interval since last live birth is the difference between the date of last live birth and the date of present birth; the interval since last fetal death is the difference between the date of last fetal death and the date of present birth. For an interval to be computed, it is necessary for both the month and year of the last live birth or the last fetal death to be valid. These intervals are computed only for events to mothers who have had at least one previous delivery.

Births for which the interval since last live birth is not stated are excluded from the computation of percents and means.

Interval since last pregnancy and outcome of last pregnancy.—Data on interval since last pregnancy and outcome of last pregnancy are derived from the computed intervals since the last live birth and the last fetal death.⁸

Births for which the interval since last pregnancy is not stated are excluded from the computation of percents and means.

Zero interval.—An interval of zero months since last live birth or fetal death indicates the second born of a set of twins, the second or third born of a set of triplets, etc. Births with an interval of zero months are excluded from the computation of mean intervals.

Educational attainment

The educational attainment of both parents was collected beginning in 1968 and was tabulated for publication in 1969 for the first time. In 1979, data on education were obtained from 46 States and the District of Columbia, as indicated in table A.

The educational attainment of either parent is defined as “the number of years of school completed.” Only those years completed in “regular” school, i.e., a formal educational system of public schools, or the equivalent in accredited private or parochial schools are counted. Business or trade schools, such as beauty and barber schools, are not considered “regular” schools for the purposes of this item. No attempt has been made to convert years of school completed in foreign school systems, ungraded school systems, etc., to equivalent grades in the American school system. Such entries have been included in the category “Not stated.”

Persons who have completed only a partial year in high school or college are tabulated as having completed the highest preceding grade. For those certificates on which a specific degree was stated, years of school completed is coded to the level at which the degree is most commonly attained, e.g., persons reporting B.A., A.B., or B.S. degrees are considered to have completed 16 years of school.

Education not stated.—The category “Not stated” includes all records in reporting areas for which there is no information on years of school completed as well as all records for which the information provided is not compatible with coding specifications.

Births tabulated as education not stated are excluded from the computations of percents.

Births to unmarried women

Marital status of the mother was reported in 39 States and the District of Columbia in 1979, as indicated in table A.

In making estimates of the number of births to unmarried women occurring in the country as a whole, the States are grouped into the nine geographic divisions. The combined ratio of out-of-wedlock births per 1,000 total live births for all reporting States in a single geographic division is then applied to all live births occurring to residents of that division. This estimating procedure is done separately by race. The sum of the estimates of out-of-wedlock births for the nine geographic divisions comprises the estimates for the United States.

In processing the data no adjustments are made for errors in the reporting of marital status on the birth record or for failure to register births to unmarried women because the extent of such reporting problems is unknown. A mother whose marital status is not stated is considered to be married.

Out-of-wedlock births for each reporting State are based on births occurring to its residents within the reporting area.

When out-of-wedlock births are reported as second or higher order births, it is not known whether previous deliveries to the mother occurred out of wedlock since the marital status of the mother at the time of these earlier births is not available from the birth record. More detailed data on births to unmarried women are given in a previous report.⁹

In 1979 marital status was not reported for about 4 percent of the Washington State birth certificates. Nonreporting was principally for births occurring in King County. Since the number of records involved was relatively large to be processed in the usual manner, an alternate procedure was used to ascertain the mother's marital status. This alternate procedure utilized information on age of father; if age of father was not stated, the mother was classified as unmarried. Increases in the number of out-of-wedlock births in Seattle and other cities in King County, Washington between 1978 and 1979 should be viewed cautiously in the light of this change in the processing for births with marital status not stated.

Birth rates for unmarried women.—Age-specific birth rates for unmarried women shown for 1941-49 are based on U.S. Bureau of the Census estimates of the unmarried female population (single, widowed, and divorced women). Rates by color are not shown for these years since the necessary estimates of the unmarried female population are not available. The rates by age and by color for 1940 and 1950 are based on decennial census counts. In this report, rates by age for 1951-79 and by age and color or race for 1955-79 are based on a smoothed series of Bureau of the Census population estimates.⁹ Since the original Bureau of the Census population estimates fluctuate erratically from year to year because of sampling error, they have been smoothed so that the rates computed from them do not show similar variations. The rates shown in this report differ, therefore, from those published in issues of *Vital Statistics of the United States* before 1969, which were based on the original estimates provided annually by the Bureau of the Census.

Due to the availability of more detailed population data, birth rates by marital status of mother by race for women aged 35-39 years and 40-44 years are shown in this volume beginning with the 1969 data year. For years before 1969, rates for women in these age groups are not available by color or race.

Attendant at birth

The tabulations of births by attendant at birth combine information about place of delivery and the person in attendance at birth. Births occurring in hos-

pitals, institutions, clinics, centers, or homes are included in the category "In hospital." In this context the word "homes" does not refer to the mother's residence but to an institution such as a home for unwed mothers. In 1977 and prior years, births in hospitals included clinic, center, or home births only when delivered by a physician. Had the categories been defined in 1977 as in later years, an additional 15,937 births would have been classified as occurring in hospitals in 1977, raising the percent of births occurring in hospitals from 98.5 to 99.0.

Births occurring in hospitals are not shown in this volume by type of attendant. However, beginning in 1975 the attendant at birth and place of delivery items were coded independently, primarily to permit the identification of the person in attendance of hospital deliveries. Although the tabulations shown in this report combine information for these two items to be consistent with previous data years, a special tabulation showed that of the 3,460,484 births that occurred in hospitals or other institutions in 1979, 98.1 percent were delivered by physicians. Of the remainder, 1.3 percent were delivered by midwives (these were probably certified nurse midwives, who are registered nurses trained in obstetrics), and 0.6 percent were delivered by persons other than physicians and midwives or by persons for whom no status was specified.

Births occurring outside hospitals are tabulated by attendant at birth rather than by place of delivery. For such births separate classifications are shown for physicians, midwives, and for "other and not specified" attendants. This last category also includes births for which no information is reported for place of birth. Before 1975, cases where the hospital item on the certificate had an entry of "doctor's office," and the birth was delivered by a physician were included in the category "In hospital." Beginning in 1975, births that were delivered by physicians in a "doctor's office" were tabulated as "Not in hospital" and included with births delivered by physicians in this category. Although the actual number of such births is unknown, the effect of the change is minimal. In 1974, 0.3 percent of all births were delivered by physicians outside of hospitals; in 1975 this proportion was 0.4 percent.

Babies born en route to the hospital are classified as having been born in the hospital. This may account for some of the hospital births not delivered by physicians.

Birth weight

In practically all areas birth weight is reported in terms of pounds and ounces rather than in grams. However, the metric system has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups.

The categories for birth weight have been changed in 1979 to be consistent with the recommendations in the Ninth Revision of the International Classification of Diseases (ICD-9). The revised categories in gram intervals and their equivalents in pounds and ounces are as follows:

Less than 500 grams	= 1 lb 1 oz. or less
500 - 999 grams	= 1 lb 2 oz - 2 lb 3 oz.
1,000 - 1,499 grams	= 2 lb 4 oz - 3 lb 4 oz
1,500 - 1,999 grams	= 3 lb 5 oz - 4 lb 6 oz
2,000 - 2,499 grams	= 4 lb 7 oz. - 5 lb 8 oz
2,500 - 2,999 grams	= 5 lb 9 oz - 6 lb 9 oz
3,000 - 3,499 grams	= 6 lb 10 oz - 7 lb 11 oz
3,500 - 3,999 grams	= 7 lb 12 oz - 8 lb 13 oz
4,000 - 4,499 grams	= 8 lb 14 oz - 9 lb 14 oz
4,500 - 4,999 grams	= 9 lb 15 oz - 11 lb 0 oz
5,000 grams or more	= 11 lb 1 oz or more

The ICD-9 defines low birth weight as less than 2,500 grams. This is a shift of one gram from the previous criterion of 2,500 grams or less which was recommended by the American Academy of Pediatrics in 1935 and adopted by the World Health Organization in the Sixth Revision of the International Lists of Diseases and Causes of Death (1948).¹⁰

After data classified by pounds and ounces are converted to grams, median weights are computed and rounded prior to publication. To establish the continuity of class intervals needed to convert pounds and ounces to grams, the end points of these intervals are assumed to be half an ounce less at the lower end and half an ounce more at the upper end. For example, 2 lb 4 oz - 3 lb 4 oz is interpreted as 2 lb 3½ oz - 3 lb 4½ oz.

Births for which birth weight is not reported are excluded from the computation of percents and medians.

Period of gestation

The period of gestation is defined as beginning with the first day of the last normal menstrual period (LMP) and ending with the day of the birth. The LMP is used as the initial date since it can be more accurately determined than the date of conception, which usually occurs 2 weeks after the LMP.

An examination of the period of gestation information reported in terms of weeks or months in previous years shows a substantial heaping at 40 weeks. This bias results from the fact that the gestation period is frequently not carefully observed and that the newborn infant of normal-size is generally assumed to have had a gestation period of 40 weeks or 9 months, depending on conventional usage. Such errors in reporting are minimized in areas where this item on the birth certificate requests the "date last normal menses began" as suggested on the 1968 revision of the U.S. Standard Certificate of Live Birth.

For 1979 the computation of period of gestation is based entirely on LMP data from the 47 States and the District of Columbia reporting LMP, indicated in table A. Gestation data for the three States reporting period of gestation in terms of weeks or months are excluded from the tabulations in this report.

Births occurring before 37 weeks of gestation are considered to be "preterm" or "premature" for purposes of classification. At 37-41 weeks gestation, births are considered to be "term" and at 42 weeks and over, "post term." These distinctions are in accordance with the definitions of ICD-9.

The period of gestation is computed only when there is a valid month, day, and year of LMP. The calculated period of gestation in completed weeks is edited for upper and lower limits. If the interval between date of last normal menstrual period and date of birth is 16 weeks or less, or 53 weeks or more, the period of gestation is considered not stated.

Due to post-conception bleeding or menstrual irregularities, the presumed date of LMP may be in error. In these instances the computed gestational period may be longer or shorter than the true gestational period, but the extent of such errors is unknown.

Month of pregnancy prenatal care began

Data on month of pregnancy prenatal care began are derived from the certificates of 49 States and the District of Columbia (see table A).¹¹

For those cases in which the name of the month is entered for this item, instead of first, second, third, etc., the month of pregnancy in which prenatal care began is determined from the month named and the month last normal menses began. If the item "date last normal menses began" is not on the certificate or not stated, month of pregnancy prenatal care began is tabulated as not stated.

Number of prenatal visits

Tabulations on the number of prenatal visits were presented for the first time in 1972. In 1979 these data were collected from the birth certificates of 47 States and the District of Columbia (see table A).

Apgar score

One- and 5-minute Apgar scores were added to the U.S. Standard Certificate of Live Birth in 1978 to evaluate the condition of the newborn infant at 1 and 5 minutes after birth. It is a useful measure of the need for resuscitation and a predictor of the infant's chances of surviving the first year of life. The Apgar score is a summary measure of the infant's condition based on heart rate, respiratory effort, muscle tone,

reflex irritability, and color. Each of these factors is given a score of 0, 1, or 2; the sum of these 5 values is the Apgar score, which ranges from 0 to 10. A score of 10 is optimum, and a low score raises some doubts about the survival and subsequent health of the infant. In 1979 the 1-minute Apgar score was included on the birth certificates of 41 States, and the 5-minute Apgar score was included on the certificates of 40 States and the District of Columbia. See table A for a listing of reporting areas.^{1,2}

QUALITY OF DATA

While vital statistics data are useful for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless various qualifying factors and methods of classification are taken into account. The factors to be considered depend on the specific purposes for which the data are to be used. It is not feasible to discuss all the pertinent factors in the use of vital statistics tabulations, but some of the more important ones should be mentioned.

Most of the factors limiting the use of data arise from imperfections in the original records or from the impracticability of tabulating these data in very detailed categories. These defects should not be ignored, but their existence does not vitiate the value of the data for most general purposes.

Completeness of registration

An estimated 99.3 percent of all births occurring in the United States in 1979 were registered. This estimate is based on the results of the 1964-68 test of birth-registration completeness according to place of delivery (in or out of hospital) and color and on the 1979 proportions of births in these categories. The primary purpose of the test was to obtain current measures of registration completeness for births in and out of hospital by color on a national basis. Data for States were not available, as they were from the previous birth-registration tests in 1940 and 1950. (For a detailed discussion of the method and results of the 1964-68 birth-registration test see U.S. Bureau of the Census, "Test of Birth-Registration Completeness, 1964 to 1968," in the *1970 Census of Population and Housing, Evaluation and Research Program, PHC(E)2*.)

The 1964-68 test has provided an opportunity to revise the estimates of birth-registration completeness for the years since the previous test in 1950 to reflect the improvement in registration. This has been done using registration completeness figures from the two tests by place of delivery and color. Estimates of registration completeness for four groups (based on place of delivery and color) for 1951-65 were computed by interpolation between the test results. (It

was assumed that the data from the more recent test are for 1966, the midpoint of the test period.) The results of the 1964-68 test are assumed to prevail for 1966 and later years. These estimates were used with the proportions of births registered in these categories to obtain revised numbers of births adjusted for underregistration for each year. The overall percent of birth-registration completeness by color was then computed. The figures for 1951-68 shown in table 1-21 differ slightly from those shown in annual reports for years prior to 1969.

Data adjusted for underregistration for 1951-59 shown in tables 1-1, 1-3, 1-4, 1-6, and 1-8 have been revised to be consistent with the 1964-68 test results and differ slightly from data shown in annual reports for years prior to 1969. For these years the published number of births and birth rates for both color groups have been revised slightly downward since the 1964-68 test indicated that previous adjustments to registered births were slightly inflated. Since registration completeness figures by age of mother and by live-birth order are not available from the 1964-68 test, it must be assumed that the relationships among these variables have not changed since 1950.

Discontinuation of adjustment for underregistration, 1960.—Adjustment for underregistration of births was discontinued in 1960, when birth registration for the United States was estimated to be 99.1 percent complete. This removed a bias introduced into age-specific rates when adjusted births classified by age were used. Age-specific rates are calculated by dividing the number of births to an age group of mothers by the population of women in that age group. Tests have shown that population figures are likely to be understated through census undercounts; these errors compensate for underregistration of births. Adjustment for underregistration of births, therefore, removes the compensating effect of underenumeration, biasing the age-specific rates more than when uncorrected birth and population data are used. (For further details see *Vital Statistics of the United States, 1963*, Volume 1, page 4-11.)

The age-specific rates used in the cohort fertility tables (tables 1-12 through 1-19) represent an exception to the above statement. These rates are computed from births corrected for underregistration and population estimates adjusted for underenumeration and misstatement of age. Adjusted births and population estimates are used for the cohort rates because they are an integral part of a series of rates, estimated with a consistent methodology. It was considered desirable to maintain consistency with respect to the cohort rates, even though it means that they will not be precisely comparable with other rates shown for 5-year age groups.

Quality control procedures

Nativity data coded by NCHS are simultaneously coded and entered onto magnetic tape for input to the computer. Errors are controlled by an independent replication of the original coding by verification clerks and by resolution of any discrepancies. Original coding entries are subject to total verification except for work by coders who maintain an error rate of 2.5 percent or less. For these qualified coders the original coding is verified on the basis of a 10-percent sample of the coded natality records until the allowable error rate is exceeded. Then their coding is verified on a 100-percent basis until it requalifies for sample verification. Errors detected by any method of verification are reviewed to determine coding bias.

Data that are coded by States and received through the vital statistics cooperative program are required to have an error rate of less than 2.0 percent for each item. In almost all of these States there is 100-percent verification of the coding. NCHS monitors the quality of these data through independent verification of a sample of records to ensure that the item error rate is not more than 2.0 percent.

After completion of coding, counts of the taped records are balanced against control totals for each shipment of records from a registration area. Impossible codes are eliminated during the editing processes on the computer and are corrected on the basis of reference to the source record or adjusted by arbitrary code assignment. All subsequent operations involved in tabulating and table preparation are verified during the computer processing or by statistical clerks.

Small frequencies

The numbers of births reported for an area represent complete counts, except for those States where data are based on a 50-percent sample. As such, they are not subject to sampling error, although they are subject to errors in the registration process. However, when the figures are used for analytical purposes, such as the comparison of rates over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have arisen under the same circumstances. The probable range of values may be estimated from the actual figures according to certain statistical assumptions.

In general, distributions of vital events may be assumed to follow the binomial distribution. Estimates of standard error and tests of significance under this assumption are described in most standard statistics texts. When the number of events is large, the standard error, expressed as a percent of the number or rate, is usually small.

When the number of events is small (perhaps less than 100) and the probability of such an event is small, considerable caution must be observed in interpreting the conditions described by the figures. Events of rare nature may be assumed to follow a Poisson probability distribution. For this distribution, a simple approximation may be used to estimate the error as follows:

If N is the number of births^a and R is the corresponding rate, the chances are 19 in 20 that

1. The "true" number of events lies between

$$N - 2 \sqrt{N} \text{ and } N + 2 \sqrt{N}$$

2. The "true" rate lies between

$$R - 2 \frac{R}{\sqrt{N}} \text{ and } R + 2 \frac{R}{\sqrt{N}}$$

If the rate R corresponding to N events is compared with the rate S corresponding to M events, the difference between the two rates may be regarded as statistically significant if it exceeds

$$2 \sqrt{\frac{R^2}{N} + \frac{S^2}{M}}$$

For example, suppose that the observed birth rate for Area A was 15.0 per 1,000 population and that this rate was based on 20 recorded births. Given prevailing conditions, the chances are 19 in 20 that the "true" or underlying birth rate for that area lies between 8.3 and 21.7 per 1,000 population. Let it be further supposed that the birth rate for Area A of 15.0 per 1,000 population were being compared with a rate of 20.0 per 1,000 population for Area B which is based on 10 recorded births. While the difference between the rates for the two areas is 5.0, this difference is less than twice the standard error of the difference

$$2 \sqrt{\frac{(15.0)^2}{20} + \frac{(20.0)^2}{10}}$$

of the two rates which is computed to be 14.3. From this, it is concluded that the difference between the rates for the two areas is not statistically significant.

^aFor States for which birth data are based on a 50-percent sample of births, N should be taken as one-half of the number of births given in the tables.

Sampling of birth records

Birth statistics presented in this report for years before 1951 and for 1955 are based on the total file of birth records. Statistics for 1951-54, 1956-66, and 1968-71 are based on 50-percent samples except data for Guam and the Virgin Islands, which are based on all the records filed. During the course of processing the 1967 data the sampling rate was reduced from 50 percent to 20 percent. For details of this procedure and its consequences for the 1967 data see *Vital Statistics of the United States, 1967*, Volume I, pages 3-9 to 3-11. Beginning in 1972, statistics are based on all records filed in the States submitting computer tapes and on a 50-percent sample of records in all other States. In 1979 the total file of birth records was used for 42 States (see Sources of Data), which accounted for about 82 percent of all births in the country.

The sample design is essentially a stratified random sample. The sampling frame consists of births that occur in the United States during a calendar year and that are recorded by State registrars of vital statistics. Each month the birth certificates that have been filed during that month are sent by local registrars to the State registrars, where the records are numbered consecutively as they are received. Therefore the records for each local registration area, usually a county, are numbered sequentially, and the total file of birth records for each State is grouped by county of occurrence. Microfilm copies of the birth records filed in the States are generally forwarded each month to NCHS, where a sample is drawn on the basis of the terminal digit of the record number. Even-numbered records are selected for the 50-percent sampling rate.

Total births by place of occurrence are not subject to sampling error. There is, however, sampling error in the total number of births when tabulated by place of residence. There is also sampling error in the numbers of births by characteristics such as color and age of mother when tabulated by either residence or occurrence.

Sampling error is the difference between an estimate based on a sample and the true value (assuming there is no measurement error). As calculated for this report the standard error reflects this error as well as random measurement errors that may have been made when the data were collected and processed. However, it does not include any systematic biases in the data. The chances are about two out of three that a sample estimate differs from the value which would have been obtained from all births by less than one standard error. The chances are about 19 out of 20 that the difference is less than twice the standard error and about 99 out of 100 that it is less than 2½ times as large.

For estimated numbers of births in 1979 by characteristics in States with a 50-percent sample, the approximate standard errors for a sampling rate of 50 percent are presented in table B. To determine the standard error of an estimate from table B, one must know the total number of births in the area and the estimate of the number of births with a specified characteristic. For estimated births with a specified characteristic by place of occurrence, the appropriate "Total births in the area" is the number occurring in the area, e.g., city, county, or State. For the estimated total number of births and the number of births with a specified characteristic by place of residence, the number of births to residents of the State is used as the total births in the area.

Table B. Standard errors of estimated births by size of estimate and total births in the area: United States, 1979

Number of births with a specified characteristic	Total births in the area ¹								
	250	500	1,000	2,000	5,000	10,000	20,000	50,000	500,000

100,000.....	300.0

¹By place of occurrence "Total births in the area" refers to the number of births occurring in the city, county, or State; by place of residence "Total births in the area" refers to the number of births to residents of the State.

For example, consider a State with 50,000 total births and an estimate of 500 births to women 30-34 years of age in an SMSA of that State. Table B shows that when "Total births in the area" is 50,000, the standard error for an estimate of 500 births is 22 births. Applying the concept stated above, the probability is 0.67 that the actual number of births is between 478 and 522 and about 0.95 that the actual number is between 456 and 544.

The sample errors shown in table B are likely to be slight overstatements for estimated numbers of births with specified characteristics by place of occurrence at the State and national levels; for county and city statistics they should be quite accurate. For the estimated total number of births and numbers of births with specified characteristics by county or city of residence, the sampling errors in table B are slightly overstated in most cases; for some areas the sampling errors may be considerably lower than those shown.

COMPUTATION OF RATES AND OTHER MEASURES

Population bases

The rates shown in this report were computed on the basis of population statistics prepared by the U.S. Bureau of the Census. Rates for 1940, 1950, 1960, and 1970 are based on the population enumerated as of April 1 in the censuses of those years. Rates for all other years are based on the estimated midyear (July 1) population for the respective years. Birth rates for the United States, individual States, and SMSA's are based on the total resident populations of the respective areas. Except as noted these populations exclude

the Armed Forces abroad but include the Armed Forces stationed in each area.

Estimates of the population of the United States by age, race, and sex are shown in table 4-2, and provisional estimates of the population of each State for 1979 are shown in table 4-3.

Population estimates by age, race, and sex for the United States and total population by State and by month are published in the *Current Population Reports*, Series P-25. Table C shows the numbers of

Table C. Sources of population data by age, race, and sex for the United States and total population by State and by month from Series P-25 of *Current Population Reports* published by the U.S. Bureau of the Census for 1970-79

Year for which data were furnished	Age, race, and sex for the United States	State	Month

Sources: Computed from populations published by the U.S. Bureau of the Census, *Census of Population, 1970, General Population Characteristics*, Final Report PC(1)-B1, United States Summary, table 52, and in *Current Population Reports*, Series P-25, No. 519, table A-2.

these reports for data furnished for 1970-79. Rates for SMSA's for 1979 are based on unpublished population estimates from the Bureau of the Census.

Population estimates for 1971. Population estimates used to compute natality rates for 1971 differ from those used to compute mortality and marriage and divorce rates. Population estimates for natality rates are based on complete-count 1970 census data adjusted to reflect postcensal corrections for overstatements of the "other races" population and of centenarians in the 1970 census. Mortality and marriage and divorce rates were computed before these population estimates became available.

Population estimates for 1961-69.—Birth rates in this volume for 1961-69 (except for those shown in tables 1-4 and 1-5) are based on revised estimates of the population and thus may differ slightly from rates published before 1976. The revised estimates used in computing these rates are published in *Current Population Reports*, Series P-25, Number 519. The rates shown in tables 1-4 and 1-5 for 1961-64 are based on revised estimates of the population published in *Current Population Reports*, Series P-25, Numbers 321 and 324 and may differ slightly from rates published in those years.

Population estimates for 1951-59.—Final intercensal estimates of the population by age, color, and sex and total population by State for 1951-59 are shown in tables 4-4 and 4-5 of Volume I, *Vital Statistics of the United States, 1966*. Beginning with 1963 these final estimates have been used to compute birth rates for 1951-59 in all issues of *Vital Statistics of the United States*.

Net census undercount

The Bureau of the Census has conducted extensive research to evaluate the coverage of the United States population (including undercount and misstatement of age, race, and sex) in the last three decennial censuses—1950, 1960, and 1970. These studies provide estimates of the national population that was not enumerated in the respective censuses, by age, color, and sex as well as a set of exploratory estimates of coverage for States.^{13,14} The reports for 1970 include ranges of estimates of net underenumeration based on alternative methodological assumptions for age, sex, and racial subgroups of the national population and illustrative estimates for individual States.

These evaluative studies indicate that there is differential coverage in the census among the population subgroups; that is, some age, color, and sex groups are more completely enumerated than others. To the extent that these estimates of undercounts are valid, that they are substantial, and that they vary among subgroups and geographic areas, census undercounts can have consequences for vital statistics meas-

ures.¹⁴ However, the effects of undercounts in the census are reduced to the extent that there is underregistration of births. If these two factors are of equal magnitude, rates based on the unadjusted populations are more accurate than those based on adjusted populations since the births have not been adjusted for underregistration.

The impact of net census undercount on vital statistics measures includes the effects on levels of the rates and effects on differentials among groups.

If adjustments were made for persons who were not counted in the census of population, the size of the denominators would generally increase and the rate would be smaller than it is without an adjustment. The adjusted rates for 1970 can be computed by multiplying the reported rate by ratios of the census-level population to the population adjusted for the estimated net census undercount which are shown in table D for the 1970 resident population of the United States. A ratio of less than 1.0 indicates a net census undercount and would result in a corresponding decrease in the rate. A ratio in excess of 1.0 indicates a net census overcount and would result in a corresponding increase in the rate.

In general, females in the childbearing ages were more completely enumerated than other age-sex groups for each racial group in 1970. The age group 25-29 years was most underenumerated for females of childbearing age (3.4 percent). White women were more completely enumerated than women of other races at all ages.

If vital statistics measures were calculated with adjustments for net census undercounts for each of these subgroups, the resulting rates would have been differentially reduced from their original levels; that is, rates for those groups with the greatest estimated undercounts would show the greatest relative reductions due to these adjustments. Thus the color differential in fertility between the white and the all other population can be affected by adjustments for net census undercount.

Cohort fertility tables

The various fertility measures shown for cohorts of women in tables 1-12 through 1-19 are computed from births adjusted for underregistration and population estimates corrected for underenumeration and misstatement of age. The data shown in this volume are not consistent with data published in annual reports prior to 1974. These data use revised population estimates prepared by the Bureau of the Census and have been expanded to include data for the two major color groups. A detailed description of the methods used in deriving these measures as well as data in more detail for earlier years are published in a separate volume.¹⁵

Age-sex-adjusted birth rates

The age-sex-adjusted birth rates shown in table 1-3 are computed by the direct method. The age distribution of women aged 10-49 years as enumerated in 1940 and the total population of the United States for that year are used as the standard populations. The birth rates by age of mother and race that are used to compute these adjusted rates are shown in table 1-6. The age-sex-adjusted birth rates show differences in the level of fertility independent of differences in the age and sex composition of the population. It is important not to confuse these adjusted rates with the crude rates shown in other tables.

Total fertility rate

The total fertility rate is the sum of the birth rates by age of mother (in 5-year age groups) multiplied by 5. It is an age-adjusted rate because it is based on the assumption that there are the same number of women in each age group. In table 1-6 the rate of 1,856 in 1979, for example, means that if a hypothetical group of 1,000 women were to have the same birth rates in each age group that were observed in the actual childbearing population in 1979, they would have a total of 1,856 children by the time they reached the end of the reproductive period (taken here as age 50), assuming that all of the women survive to that age.

Intrinsic vital rates

The intrinsic vital rates shown in table 1-5 are calculated from a stable population. A stable population is that hypothetical population, closed to external migration, which would become fixed in age-sex structure after repeated applications of a constant set of age-sex specific birth and death rates. (For the mathematical derivation of intrinsic vital rates see *Vital Statistics of the United States, 1962*, Volume I, pages 4-13 and 4-14. For the technique of calculating intrinsic vital rates see *Techniques of Population Analysis*, by George W. Barclay, New York, John Wiley and Sons, Incorporated, 1958, pages 216-222.)

Parity distribution

The percent distribution of women by parity (number of children ever born alive to mother) shown in tables 1-13 and 1-17 is derived from cumulative birth rates by order of birth, which are shown in tables 1-15 and 1-19. The percent of zero-parity

women is found by subtracting the cumulative first birth rate from 1,000 and dividing by 10. The proportions of women at parities one through six are found from the following formula:

$$\text{Percent at } N \text{ parity} = \frac{(\text{cum. rate, order } N) - (\text{cum. rate, order } N+1)}{10}$$

The percent of women at seventh and higher parities is found by dividing the cumulative rate for seventh order births by 10.

Seasonal adjustment of rates

The seasonally adjusted birth and fertility rates shown in table 1-23 are computed from the X-11 variant of Census Method II.¹⁶ This method of seasonal adjustment used since 1964 differs slightly from the BLS Seasonal Factor Method, which was used for *Vital Statistics of the United States, 1964*. The fundamental technique is the same in that it is an adaptation of the ratio-to-moving-average method. Prior to 1964 the method of seasonal adjustment was based on the X-9 variant and other variants of Census Method II. A comparison between Census Method II and the BLS Seasonal Factor Method shows the differences in the seasonal patterns of births to be negligible.¹⁷

Seasonally adjusted rates for 1978 have been revised and differ from those published in *Vital Statistics of the United States, 1978*. No changes have been made in the rates for 1977 and prior years.

Computation of percents, medians, and means

Percent distributions, medians, and means are computed using only events for which the characteristic is reported. The "Not stated" category is subtracted from the total before computation of these measures. Data are shown with an asterisk (*) when the base of the percent, median, or mean is less than 20 events.
