Please note that while IBM is emphasizing outside environments, such as smoking, that back in the 60's 70's, etc. smoking was not publicly known to cause cancer as it is today. If it were, why then would industries of all sorts allow it in the workplace? As for heretary, everyone is born with cancer cells, it just takes something to grab hold of them and they take off. Immune systems are different in each individual so one must look at that during the study on why some get cancer and some don't. Also the amount of hours each individual work(s) in the chemical areas. For me, I never worked under a 8 hour day. first illness in 1968, diagnosed with muptiple chemical sensitivities (upper respiratory disease), with 1970s. I have my msds sheets, and IBM health file which I obtained on my last day there. Why not advertise on TV, paper for IBM employees to contact you if they or a family member worked in a chemical area? That would help the process.
